

ATTACHMENT 6
PROPOSAL MONITORING

As part of this project, an inspector from the County of Los Angeles Department of Public Works (Public Works) Construction Division will be on site at all times the contractor is present to monitor their construction activities and best management practices. By doing so, the inspector can ensure that the contractor installs all necessary pipeline and appurtenances correctly, thus ensuring there are minimal future leaks along the new line. This will result in water savings due to the operation of a new waterline that will not experience the numerous leaks as in the old deteriorating pipe, energy savings due to not having to activate the booster pumps in order make up for the difference with the water loss due to the leak, and less greenhouse gas emissions due to less Waterworks field crews having to drive to the leak area for repair.

Public Works Construction Division inspectors have been used on most of the Waterworks projects in the past and have provided quality monitoring of the contractors.
